CS2040 Lecture Note #4: Stacks and Queues

Two basic ADTs and linear data structures

Lecture Note #4: Stacks and Queues

Objectives:

- Able to define a Stack ADT, and to implement it with array and linked list
- Able to define a Queue ADT, and to implement it with array and linked list
- Able to use stack and queue in applications
- Able to use Java API Stack class and Queue interface

Outline

- Stack ADT (Motivation)
- 2. Stack Implementation via Array
- 3. Stack Implementation via Linked List
- 4. java.util.Stack <E>
- 5. Stack Applications
 - Bracket matching
 - Postfix calculation
- 6. Queue ADT (Motivation)
- 7. Queue Implementation via Array
- 8. Queue Implementation via Tailed Linked List
- 9. java.util.interface Queue <E>
- 10. Queue Application: Palindromes

__ [CS2040 Lecture 4 AY2018/19 S2] _______

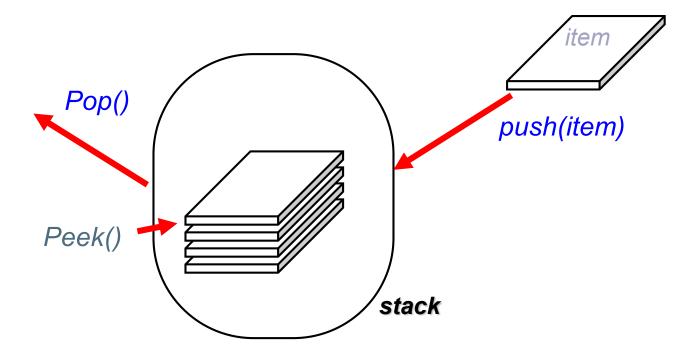

1-5 Stacks

Last-In-First-Out (LIFO)

1 Stack ADT: Operations

- A Stack is a collection of data that is accessed in a lastin-first-out (LIFO) manner
- Major operations: "push", "pop", and "peek".

_ [CS2040 Lecture 4 AY2018/19 S2] _____

1 Stack ADT: Uses

- Calling a function
 - Before the call, the state of computation is saved on the stack so that we will know where to resume
- Recursion
- Matching parentheses
- Evaluating arithmetic expressions (e.g. a + b c) :
 - postfix calculation
 - Infix to postfix conversion
- Traversing a maze

- [CS2040 Lecture 4 AY2018/19 S2]

1 Stack ADT: Interface

StackADT.java import java.util.*; public interface StackADT <E> { // check whether stack is empty public boolean empty(); // retrieve topmost item on stack peek() throws EmptyStackException; public E // remove and return topmost item on stack // insert item onto stack public void push(E item);

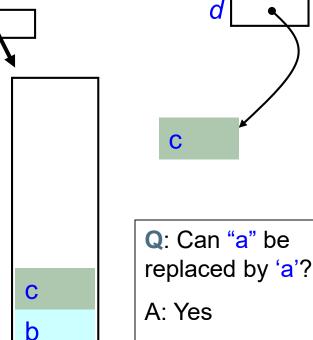

_ [CS2040 Lecture 4 AY2018/19 S2] ______

1 Stack: Usage

```
→ Stack s = new Stack();

                                       S
 → s.push ("a");
 → s.push ("b");
 ⇒ s.push ("c");
 \rightarrow d = s.peek ();
 ⇒ s.pop ();
 ⇒ s.push ("e");
 → s.pop ();
                                                a
To be accurate, it is the references to
```

"a", "b", "c", ..., being pushed or popped.

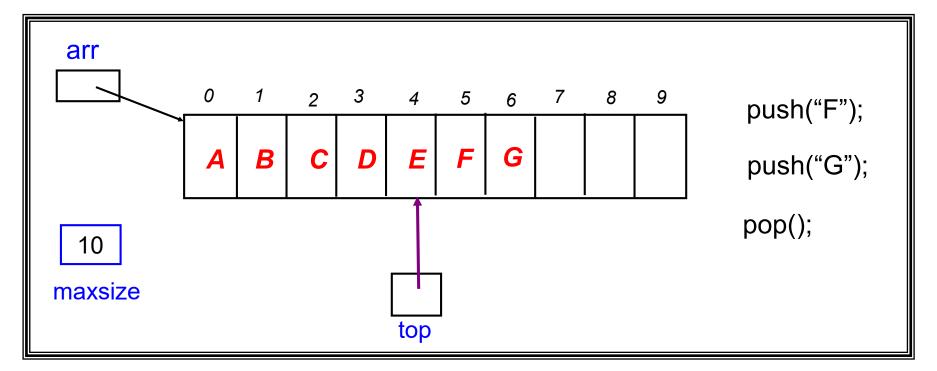

B: No

2 Stack Implementation: Array (1/4)

Use an Array with a top index pointer

StackArr

__ [CS2040 Lecture 4 AY2018/19 S2] ______

2 Stack Implementation: Array (2/4)

```
StackArr.java
import java.util.*;
class StackArr <E> implements StackADT <E> {
  private E[] arr;
  private int top;
  private int maxSize;
  private final int INITSIZE = 1000;
  public StackArr() {
    arr = (E[]) new Object[INITSIZE]; // creating array of type E
    top = -1; // empty stack - thus, top is not on an valid array element
    maxSize = INITSIZE:
  }
  public boolean empty() {
    return (top < 0);</pre>
```

2 Stack Implementation: Array (3/4)

pop() uses peek()

```
public E peek() throws EmptyStackException {
  if (!empty()) return arr[top];
  else throw new EmptyStackException();
}

public E pop() throws EmptyStackException {
  E obj = peek();
  top--;
  return obj;
}
```

2 Stack Implementation: Array (4/4)

push() needs to consider overflow

```
StackArr.java
public void push(E obj) {
  if (top >= maxSize - 1) enlargeArr();
  top++;
  arr[top] = obj;
private void enlargeArr() {
  // When there is not enough space in the array
  // we use the following method to double the number
  // of entries in the array to accommodate new entry
  int newSize = 2*maxSize;
  E[] x = (E[])  new Object[newSize];
  for (int j=0; j < maxSize; j++) {</pre>
    x[i] = arr[i];
  maxSize = newSize;
  arr = x;
```

3 Stack Implementation: Linked List (1/7)

A class can be defined in 2 ways:

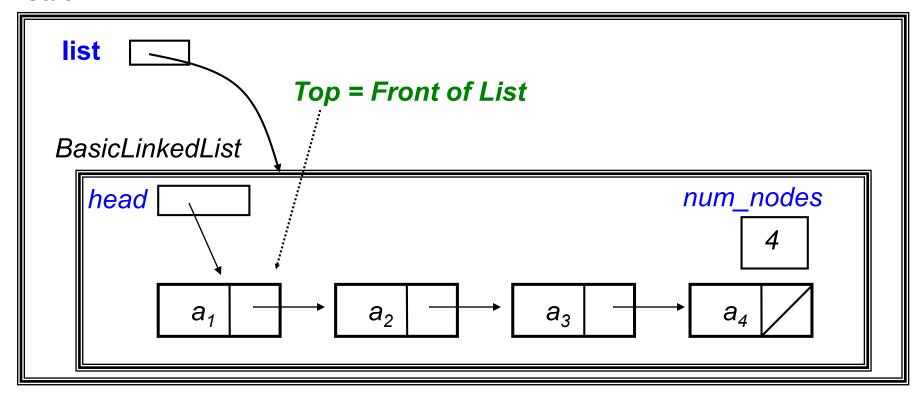

```
via composition:
    class A {
      B b = new B (...); // A is composed of instance of B
via inheritance:
     class A extends B { // A is an extension of B
```

_ [CS2040 Lecture 4 AY2018/19 S2]

3 Stack Implementation: Linked List (2/7)

Method #1 (Composition): Use BasicLinkedList

StackLL

3 Stack Implementation: Linked List (3/7)

Method #1 (Composition): Use BasicLinkedList

```
StackLL.java
import java.util.*;
class StackLL <E> implements StackADT <E> {
 private BasicLinkedList <E> list;
 public StackLL() {
   list = new BasicLinkedList <E> ();
 public boolean empty() { return list.isEmpty(); }
 public E peek() throws EmptyStackException {
   try {
     return list.getFirst();
    } catch (NoSuchElementException e) {
     throw new EmptyStackException();
```

3 Stack Implementation: Linked List (4/7)

Method #1 (Composition): Use BasicLinkedList

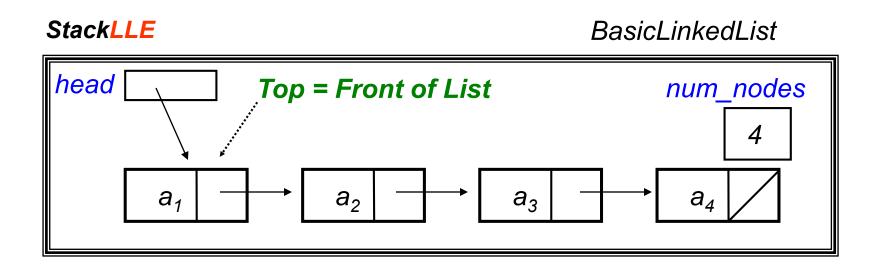

```
public E pop() throws EmptyStackException {
    E obj = peek();
    list.removeFirst();
    return obj;
}

public void push(E o) {
    list.addFirst(o);
}
```

Do you need to worry about overflow with LinkedList implementation?

3 Stack Implementation: Linked List (5/7)

Method #2 (Inheritance): Extend BasicLinkedList

3 Stack Implementation: Linked List (6/7)

Method #2 (Inheritance): Extend BasicLinkedList

```
StackLLE.java
import java.util.*;
class StackLLE <E> extends BasicLinkedList <E> implements StackADT <E> {
 public boolean empty() {
    return isEmpty();
 public E peek() throws EmptyStackException {
    try {
     return getFirst();
    } catch (NoSuchElementException e) {
      throw new EmptyStackException();
```

3 Stack Implementation: Linked List (7/7)

Method #2 (Inheritance): Extend BasicLinkedList

```
StackLLE.java
public E pop() throws EmptyStackException {
  // write your code below
public void push (E o) {
  // write your code below
```

3 Uses of Stacks

```
TestStack.java
import java.util.*;
class TestStack {
  public static void main (String[] args) {
    // You can use any of the following 4 implementations of Stack
    StackArr <String> stack = new StackArr <String>(); // Array
    //StackLL <String> stack = new StackLL <String>(); // LinkedList composition
    //StackLLE <String> stack = new StackLLE <String>(); // LinkedList inheritance
    //Stack <String> stack = new Stack <String>(); // Java API
    System.out.println("stack is empty? " + stack.empty());
    stack.push("1");
    stack.push("2");
    System.out.println("top of stack is " + stack.peek());
    stack.push("3");
    System.out.println("top of stack is " + stack.pop());
    stack.push("4");
    stack.pop();
    stack.pop();
    System.out.println("top of stack is " + stack.peek());
```

[CS2040 Lecture 4 AY2018/19 S2]

4 java.util.Stack $\langle E \rangle$ (1/2)

Constructor Summary

Stack()

Creates an empty Stack.

Method Summary

boolean	empty()
	Tests if this stack is empty.
<u>E</u>	peek()
	Looks at the object at the top of this stack without removing
	it from the stack.
<u>E</u>	<u>pop</u> ()
	Removes the object at the top of this stack and returns that object as the value of this function.
E	push(E item)
	Pushes an item onto the top of this stack.
int	search(Object o)
	Returns the 1-based position where an object is on this stack.

Note: The method "int search (Object o)" is not commonly known to be available from a Stack.

4 java.util.Stack $\langle E \rangle$ (2/2)

Methods inherited from class java.util. Vector

add, add, addAll, addAll, addElement, capacity, clear, clone, contains, containsAll, copyInto, elementAt, elements, ensureCapacity, equals, firstElement, get, hashCode, indexOf, indexOf, insertElementAt, isEmpty, lastElement, lastIndexOf, lastIndexOf, remove, remove, removeAll, removeAllElements, removeElement, removeElementAt, removeRange, retainAll, set, setElementAt, setSize, size, subList, toArray, toArray, toString, trimToSize

Methods inherited from class java.util. AbstractList

iterator, listIterator, listIterator

Methods inherited from class java.lang.Object

finalize, getClass, notify, notifyAll, wait, wait, wait

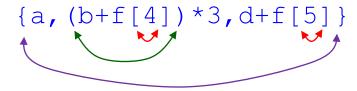

Methods inherited from interface java.util.List

iterator, listIterator, listIterator

5 Application 1: Bracket Matching (1/2)

Ensures that pairs of brackets are properly matched

An example:

Incorrect examples:

// too many close brackets

// too many open brackets

// mismatched brackets

5 Application 1: Bracket Matching (2/2)

```
create empty stack
for every char read
                             Q: What type of error does
                             the last line test for?
 if open bracket then
                             A: too many closing brackets
    push onto stack
                             B: too many opening brackets
 if close bracket, then
                             C: bracket mismatch
    pop from the stack
   if doesn't match or underflow then flag error
if stack is not empty then flag error
```

{ a,(b+f[4]) * 3, d+f[5]}

Stack

Example

5 Application 2: Arithmetic Expression (1/6)

Terms

Expression: a = b + c * d

Operands: a, b, c, d

□ Operators: =, +, -, *, /, %

- Precedence rules: Operators have priorities over one another as indicated in a table (which can be found in most books)
 - Example: *, / have higher precedence over +, -.
 - For operators at the same precedence (such as * and /, we associate them from left to right

5 Application 2: Arithmetic Expression (2/6)

Infix - operand1 operator operand2

Prefix - operator operand1 operand2

Postfix - operand1 operand2 operator

Ambiguous, need () or precedence rules

Infix

Unique interpretation

postfix

2+3*4

Unique interpretation

postfix

- [CS2040 Lecture 4 AY2018/19 S2]

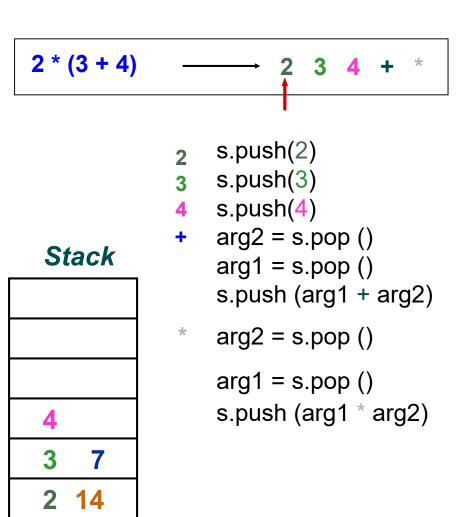

5 Application 2: Arithmetic Expression (3/6)

Algorithm: Calculating Postfix expression with stack

arg1

arg2

```
Create an empty stack
for each item of the expression,
if it is an operand,
push it on the stack
if it is an operator,
pop arguments from stack;
perform the operation;
push the result onto the stack
```

5 Application 2: Arithmetic Expression (4/6)

Algorithm: Converting Infix to an equivalent Postfix

```
String postfixExp = "";
for (each character ch in the infix expression) {
 switch (ch) {
  case operand: postfixExp = postfixExp + ch; break;
  case '(': stack.push(ch); break;
  case ')':
     while ( stack.peek() != '(')
       postfixExp = postfixExp + stack.pop();
     stack.pop(); break; // remove '('
  case operator:
     while (!stack.empty() && stack.peek() != '(' &&
         precedence(ch) <= precedence(stack.peek()) )</pre>
         postfixExp = postfixExp + stack.pop();
      stack.push(ch); break;
  } // end switch
} // end for
while (!stack.empty())
    postfixExp = postfixExp + stack.pop();
```

5 Application 2: Arithmetic Expression (5/6)

Algorithm: Converting Infix to an equivalent Postfix

```
<u>ch</u>
      Stack (bottom to top)
                              postfixExp
                                               Example: a - (b + c * d) / e
a
                              a
                              a
b
                              a b
                              a b
                              a b c
                              a b c
                              abcd
d
                                                Move operators from
                              abcd*
                                                stack to postfixExp until '('
                              abcd*+
                              abcd*+
                              abcd*+
                              abcd*+e
                                                Copy remaining operators
                                                from stack to postfixExp
                              abcd*+e/-
```

_ [CS2040 Lecture 4 AY2018/19 S2]

5 Application 2: Arithmetic Expression (6/6)

- How to code the above algorithm in Java?
 - Complete Postfix.java
- How to do conversion of infix to prefix?
 - See Prefix.java

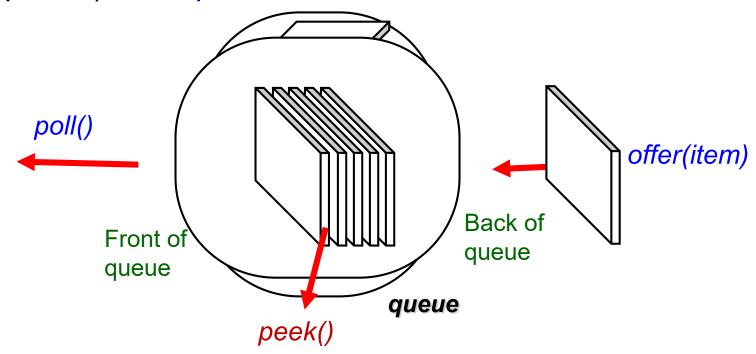

6-10 Queues

First-In-First-Out (FIFO)

6 Queue ADT: Operations

- A Queue is a collection of data that is accessed in a firstin-first-out (FIFO) manner
- Major operations: "poll" (or "dequeue"), "offer" (or "enqueue"), and "peek".

6 Queue ADT: Uses

- Print queue
- Simulations
- Breadth-first traversal of trees
- Checking palindromes for illustration only as it is not a real application of queue

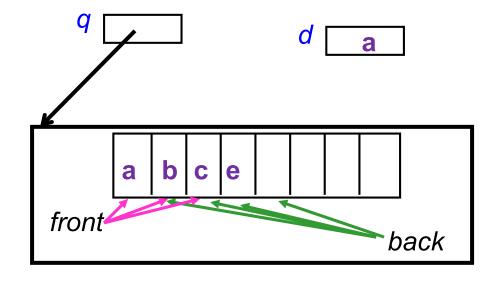

6 Queue ADT: Interface

QueueADT.java import java.util.*; public interface QueueADT <E> { // return true if queue has no elements public boolean isEmpty(); // return the front of the queue public E peek(); // remove and return the front of the queue public E poll(); // also commonly known as dequeue // add item to the back of the queue public boolean offer(E item); // also commonly known as enqueue

6 Queue: Usage

```
Queue q = new Queue ();
```

- → q.offer ("a");
- \rightarrow q.offer ("b");
- \rightarrow q.offer ("c");
- \rightarrow d = q.peek ();
- **→** q.poll ();
- **→** q.offer ("e");
- **→** q.poll ();

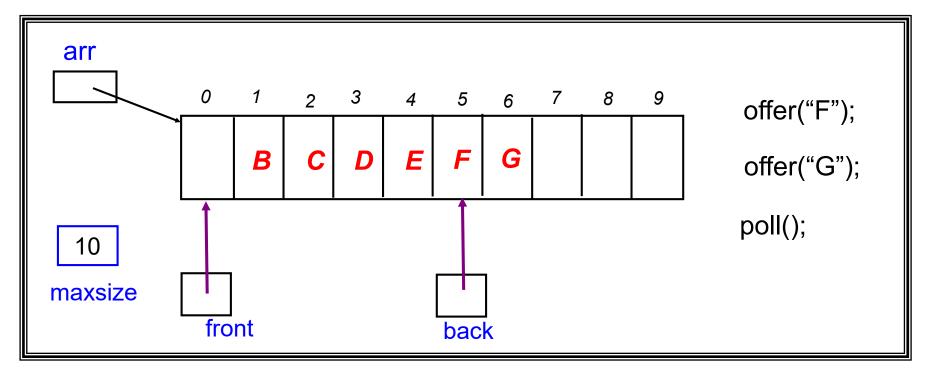

[CS2040 Lecture 4 AY2018/19 S2]

7 Queue Implementation: Array (1/7)

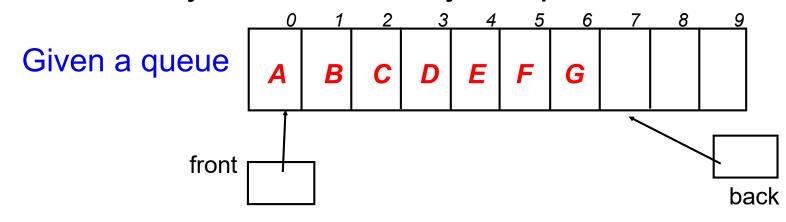

Use an Array with front and back pointer

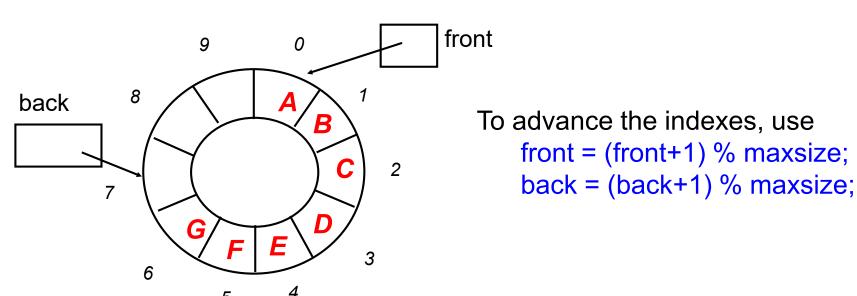

QueueArr

7 Queue Implementation: Array (2/7)

"Circular" Array needed to recycle space

[CS2040 Lecture 4 AY2018/19 S2]

7 Queue Implementation: Array (3/7)

Question: what does (front == back) mean?

A: Full queue

B: Empty queue

C: Both A and B

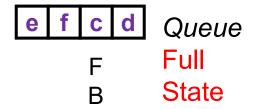

D: Neither A nor B

③

7 Queue Implementation: Array (4/7)

Ambiguous full/empty state

```
Queue F
State B
```

```
Solution 1 – Maintain queue size or full status
size 0 size 4
```

Solution 2 (Preferred and used in our codes) - Leave a gap!

Don't need the size field this way

e c d

Full Case: (((B+1) % maxsize) == F)

B F

Empty Case: F == B

7 Queue Implementation: Array (5/7)

```
QueueArr.java
import java.util.*;
// This implementation uses solution 2 to resolve full/empty state
class QueueArr <E> implements QueueADT <E> {
  private E [] arr;
  private int front, back;
  private int maxSize;
  private final int INITSIZE = 1000;
  public QueueArr() {
    arr = (E []) new Object[INITSIZE]; // create array of E objects
    front = 0; // the queue is empty
    back = 0:
    maxSize = INITSIZE;
  }
  public boolean isEmpty() {
    return (front == back);
```

7 Queue Implementation: Array (6/7)

```
public E peek() {
                                                QueueArr.java
  if (isEmpty()) return null;
  else return arr[front];
public E poll() {
  if (isEmpty()) return null;
  E obj = arr[front];
  arr[front] = null;
  front = (front + 1) % maxSize;
  return obj;
}
public boolean offer(E o) {
  if (((back+1)%maxSize) == front) // array is full
    if (!enlargeArr()) return false; // no more memory to
                                      // enlarge the array
  arr[back] = o;
 back = (back + 1) % maxSize;
  return true;
```

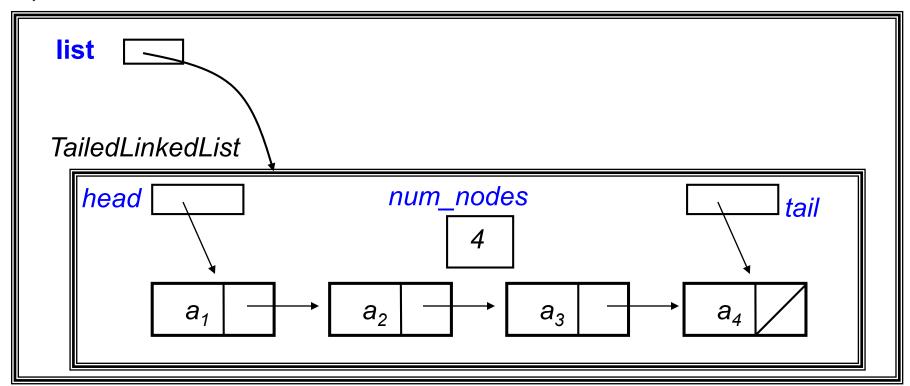

7 Queue Implementation: Array (7/7)

```
QueueArr.java
private boolean enlargeArr() {
  int newSize = maxSize * 2;
  E[] x = (E [])  new Object[newSize];
  if (x == null) // i.e. no memory allocated to array of E objects
    return false;
  for (int j=0; j < maxSize; j++) {</pre>
    // copy the front (1st) element, 2nd element, ..., in the
    // original array to the 1st (index 0), 2nd (index 1), ...,
    // positions in the enlarged array
    x[j] = arr[(front+j) % maxSize];
  front = 0;
  back = \max \overline{Size} - 1:
  arr = x;
  maxSize = newSize;
  return true;
```

8 Queue Implementation: Linked List (1/4)

- Method #1 (Composition): Use TailedLinkedList
 - Do not use BasicLinkedList as we would like to have AddLast()

QueueLL

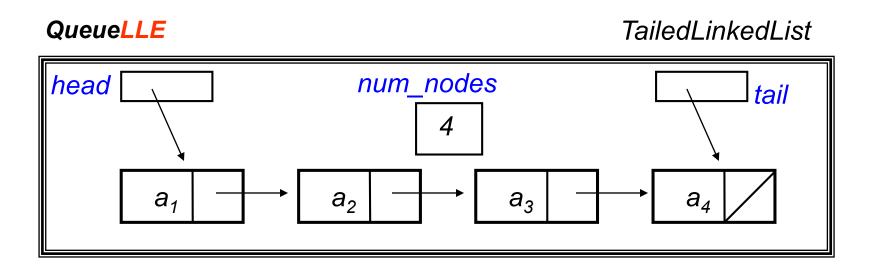

8 Queue Implementation: Linked List (2/4)

Method #1 (Composition): Use TailedLinkedList

```
QueueLL.java
import java.util.*;
class QueueLL <E> implements QueueADT <E> {
  private TailedLinkedList <E> list;
  public QueueLL() { list = new TailedLinkedList <E> (); }
  public boolean isEmpty() { return list.isEmpty(); }
  public boolean offer(E o) {
    list.addLast(o);
    return true;
  public E peek() {
    if (isEmpty()) return null;
    return list.getFirst();
  public E poll() {
    E obj = peek();
    if (!isEmpty()) list.removeFirst();
    return obj;
```

8 Queue Implementation: Linked List (3/4)

Method #2 (Inheritance): Extend TailedLinkedList

8 Queue Implementation: Linked List (4/4)

Method #2 (Inheritance): Extend TailedLinkedList

```
QueueLLE.java
import java.util.*;
class QueueLLE <E> extends TailedLinkedList <E> implements QueueADT <E> {
  public boolean offer(E o) {
    // write your code below
  }
  public E peek() {
    // write your code below
  public E poll() {
    // write your code below
```

– [CS2040 Lecture 4 AY2018/19 S2]

8 Uses of Queues (1/2)

TestQueue.java

```
import java.util.*;
class TestStack {
  public static void main (String[] args) {
  // you can use any one of the following implementation
  //QueueArr <String> queue= new QueueArr <String> (); // Array
  QueueLL <String> queue= new QueueLL <String> (); // LinkedList composition
  //QueueLLE <String> queue= new QueueLLE <String> (); // LinkedList inheritance
  System.out.println("queue is empty? " + queue.isEmpty());
  queue.offer("1");
  System.out.println("operation: queue.offer(\"1\")");
  System.out.println("queue is empty? " + queue.isEmpty());
  System.out.println("front now is: " + queue.peek());
  queue.offer("2");
  System.out.println("operation: queue.offer(\"2\")");
  System.out.println("front now is: " + queue.peek());
  queue.offer("3");
  System.out.println("operation: queue.offer(\"3\")");
  System.out.println("front now is: " + queue.peek());
```

[CS2040 Lecture 4 AY2018/19 S2]

8 Uses of Queues (2/2)

```
queue.poll();
System.out.println("operation: queue.poll()");
System.out.println("front now is: " + queue.peek());
System.out.print("checking whether queue.peek().equals(\"1\"): ");
System.out.println(queue.peek().equals("1"));
queue.poll();
System.out.println("operation: queue.poll()");
System.out.println("front now is: " + queue.peek());
queue.poll();
System.out.println("operation: queue.poll()");
System.out.println("operation: queue.poll()");
System.out.println("front now is: " + queue.peek());
}
```

◈

9 java.util.interface Queue <E>

Method Summary E element() Retrieves, but does not remove, the head of this queue. boolean offer(E o) Inserts the specified element into this queue, if possible. E peek() Retrieves, but does not remove, the head of this queue, returning null if this queue is empty. E poll() Retrieves and removes the head of this queue, or null if this queue is empty. E remove() Retrieves and removes the head of this queue.

Methods inherited from interface java.util.Collection

<u>add</u>, <u>addAll</u>, <u>clear</u>, <u>contains</u>, <u>containsAll</u>, <u>equals</u>, <u>hashCode</u>, <u>isEmpty</u>, <u>iterator</u>, <u>remove</u>, <u>removeAll</u>, <u>retainAll</u>, <u>size</u>, <u>toArray</u>, <u>toArray</u>

Note: The methods "E element()" and "E remove()" are not in our own Queue ADT.

10 Application: Palindromes (1/3)

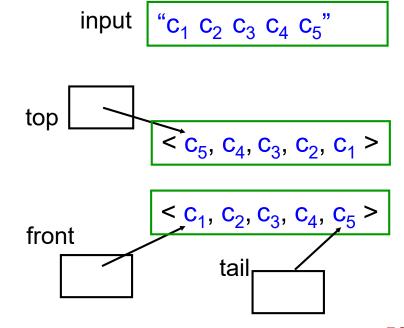

- A string which reads the same either left to right, or right to left is known as a palindrome
 - □ Palindromes: "radar", "deed", "aibohphobia"
 - □ Non-palindromes: "data", "little"

Algorithm

Given a string, use:

- a Stack to reverse its order
- a Queue to preserve its order

Check if the sequences are the same

[CS2040 Lecture 4 AY2018/19 S2]

10 Application: Palindromes (2/3)

```
Palindromes.java
import java.util.*;
class Palindromes {
  public static void main (String[] args) throws NoSuchElementException {
    // you can use any of the following stack/queue implementations
    //StackLLE <String> stack = new StackLLE <String> ();
   Stack <String> stack = new Stack <String> ();
    //StackLL <String> stack = new StackLL <String> ();
    //StackArr <String> stack = new StackArr <String> ();
    //QueueLL <String> queue = new QueueLL <String> ();
    //QueueLLE <String> queue = new QueueLLE <String> ();
    //QueueArr <String> queue = new QueueArr <String> ();
   Queue <String> queue = new LinkedList <String> ();
                                                      Queue is an interface in Java
    Scanner scanner = new Scanner(System.in)
                                                      API
    System.out.print("Enter text: ");
                                                      LinkedList is a class that
    String inputStr = scanner.next();
                                                      implements Queue and other
                                                      interfaces, such as
    for (int i=0; i < inputStr.length(); i++) {</pre>
                                                      Serializable, Cloneable,
      String ch = inputStr.substring(i, i+1);
                                                      Iterable<E>, Collection<E>,
      stack.push(ch);
                                                      Deque<E>, List<E>.
     queue.offer(ch);
```

_ [CS2040 Lecture 4 AY2018/19 S2]

10 Application: Palindromes (3/3)

```
Palindromes.java
boolean ans = true;
try {
  while (!stack.isEmpty() && ans) {
    if (!(stack.pop().equals(queue.poll())))
           ans = false;
} catch (NoSuchElementException e) {
  throw new NoSuchElementException();
}
System.out.print(inputStr + " is ");
if (ans)
  System.out.println("a palindrome");
else
  System.out.println("NOT a palindrome");
```

6 Summary

- We learn to create our own data structures from array and linked list
 - LIFO vs FIFO a simple difference that leads to very different applications
 - Drawings can often help in understanding the cases still
- Please do not forget that the Java Library class is much more comprehensive than our own – for sit-in lab or exam, please use the one as told.
